# ABOUT OUR I.S. MACHINE CLEANING SERVICES

---

Kingfisher Industrial Services is one of the only companies in the UK that offer complete, thorough and timely Individual Section/Independent Section I.S. machine cleaning for glass manufacturing plants.

Over time, it is easy for the moulds, girders, gantries, pipes and other moving parts of I.S. machines to become coated in oil, dirt and grime.

This build-up can potentially cause breakdowns of machinery or the contamination of products, both of which can cost you time, money, customers and reputation.

## THE KINGFISHER GUARANTEE

We are proud of our reputation as a leading specialist industrial cleaning company which develops and innovates bespoke solutions to best suit our customers' requirements. Our I.S. Machine Cleaning process is continually developed to ensure the highest possible results for our clients.

# YOUR I.S. MACHINE CLEAN

---

Here at Kingfisher, we understand the importance of uninterrupted production. We ensure that your I.S. machine clean is planned and undertaken during scheduled downtime, for either a complete, thorough clean or a shorter clean in-between mould line changes.

We recommend a deeper clean during planned shutdown maintenance, between 1-3 days per machine, to ensure a more thorough result.

However, we also cater to emergency shutdowns in order to take advantage of unexpected downtime for cleaning maintenance. No matter the notice, we encourage you to get in touch as we always prioritise your scheduling.

## PROJECT MANAGEMENT

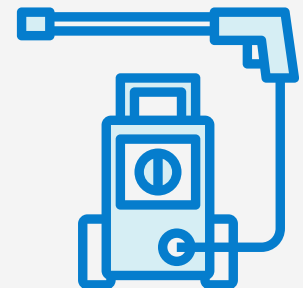

---

Kingfisher will plan and manage the entire process so that our clients can focus on what they do best.

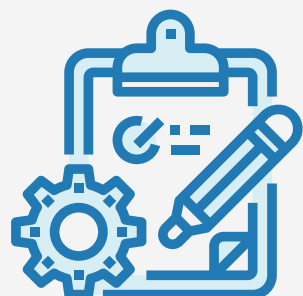

We provide all the equipment needed, including high pressure jet washers and chemical cleaning agents. The project will, of course, be planned around our client's timescales and requirements. Regular updates with progress photos will be delivered throughout the process.

**BOOK DURING  
PLANNED

OR EMERGENCY  
SHUTDOWN**

**HIGH PRESSURE  
STEAM**

**FULLY MANAGED  
BY KINGFISHER**

1

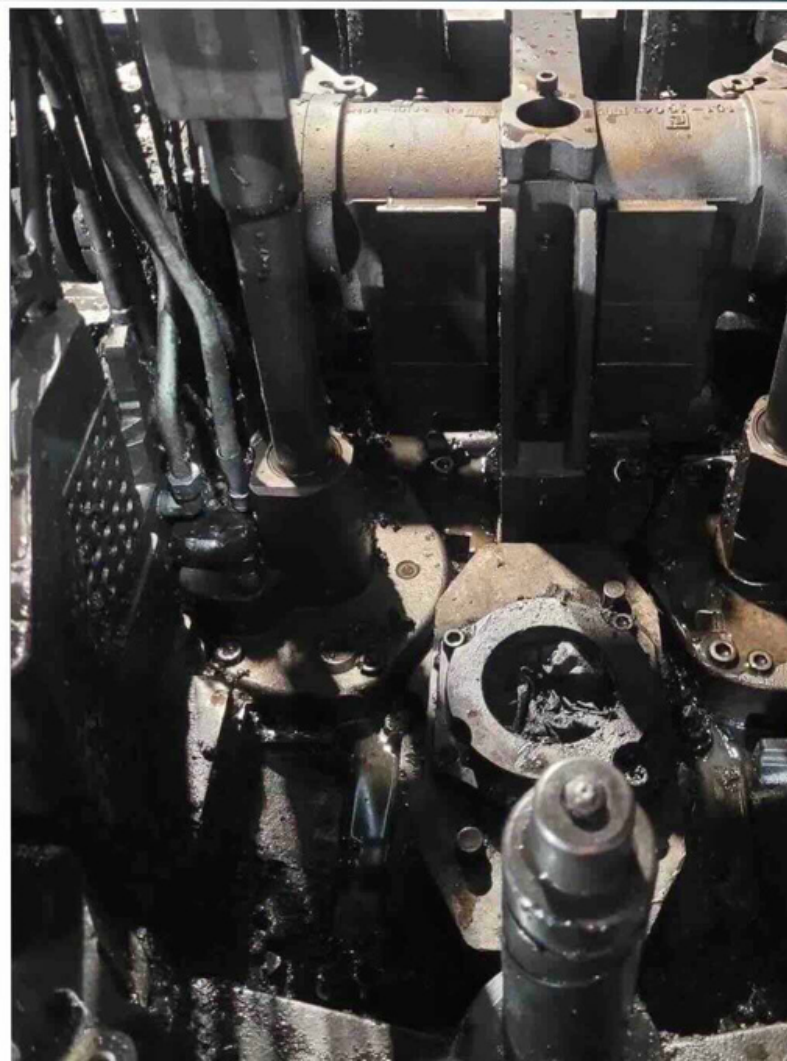

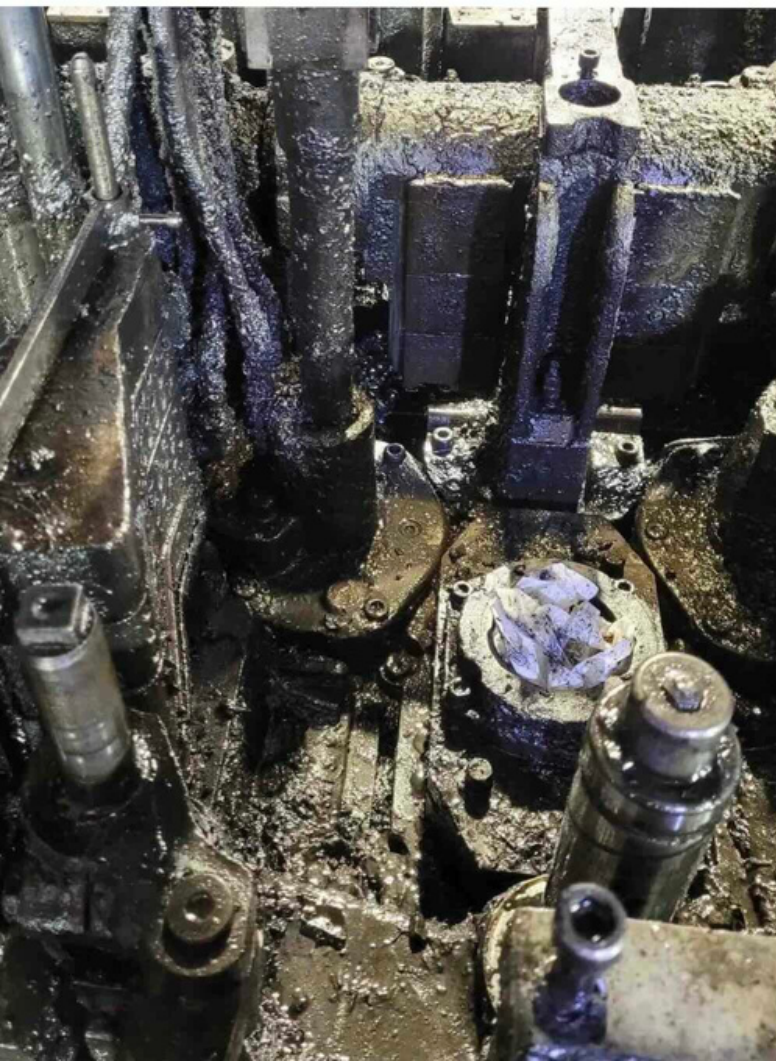

## Project set up

We provide all necessary equipment and tools. The area immediately around the I.S. Machine is enclosed in tarpaulin, preventing oil contamination of nearby machines and production areas.

2

## Clean up begins

We use high-powered specialist steam machines, to minimise water ingress into the mechanical sections of the I.S. Machine. We make sure that sensitive electrical areas of the I.S. Machine are protected during the cleaning process, which then themselves receive a chemically controlled manual clean. Oil, dust, grease and other waste material build-up is removed from the surfaces of the machine.

## All areas are completed

3

We ensure that all areas of the production machine are cleaned:

**High-level steel work on blank side and mould sides**

**Upright mechanical sections on blank and mould sides**

**Removing glass and oil materials and cleaning around the mould sections on both sides of the machine**

**All control panelling**

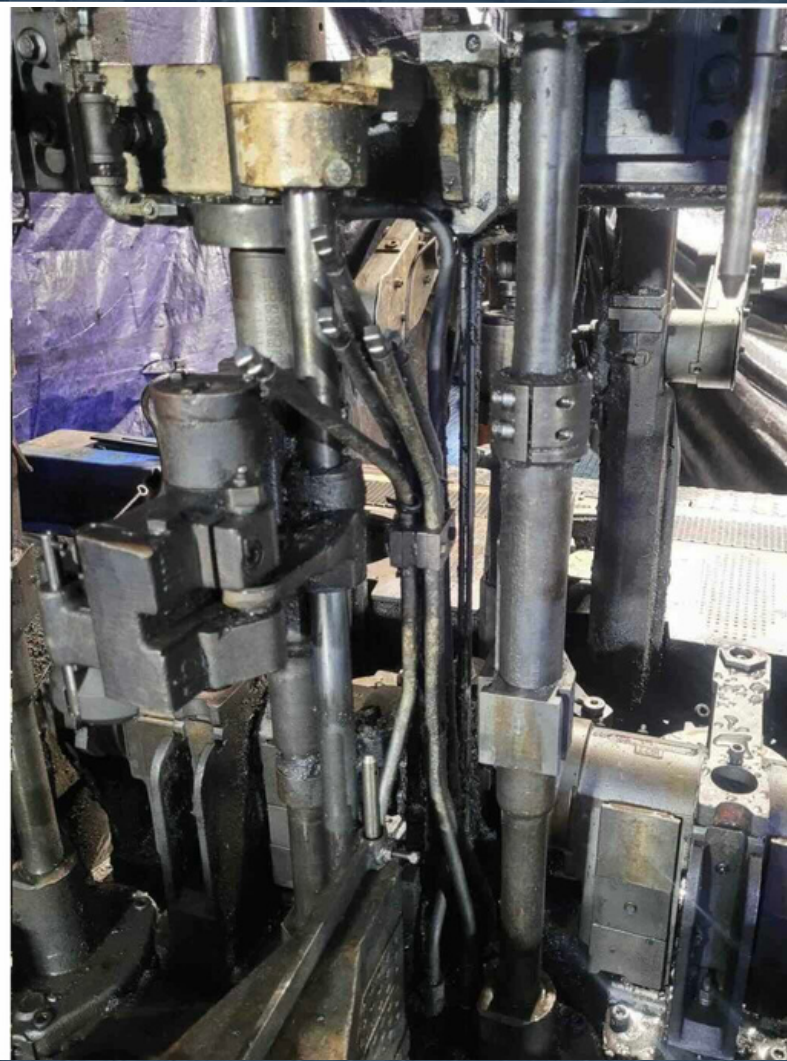

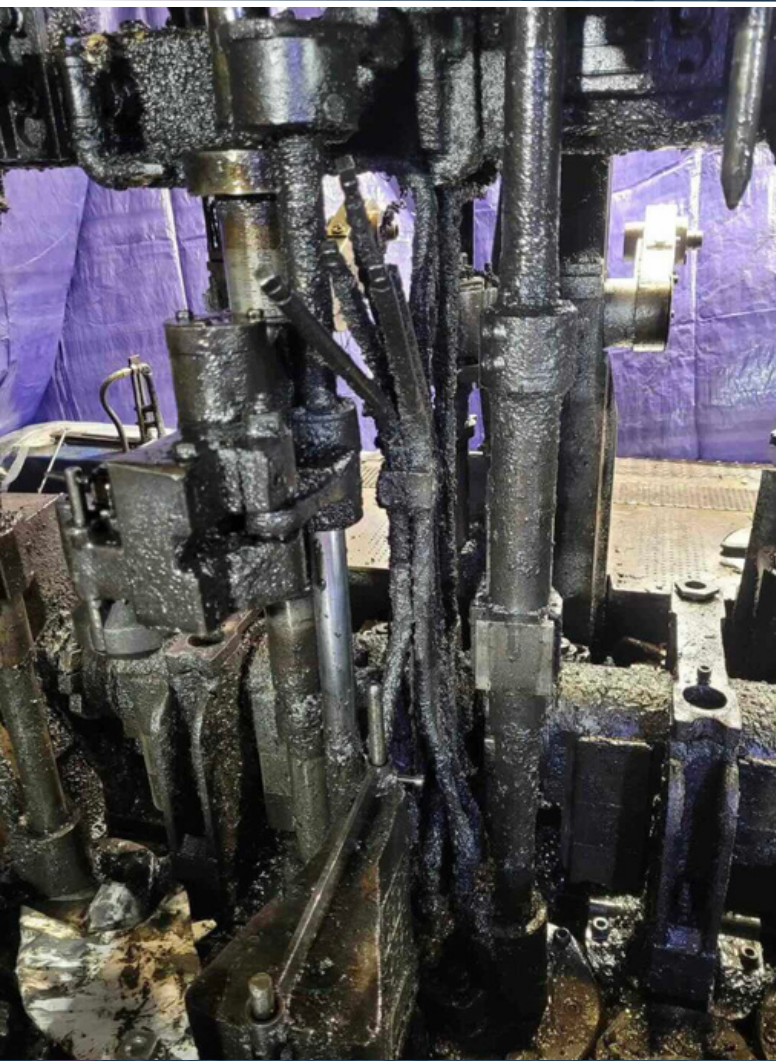

**All floor box sections**

4

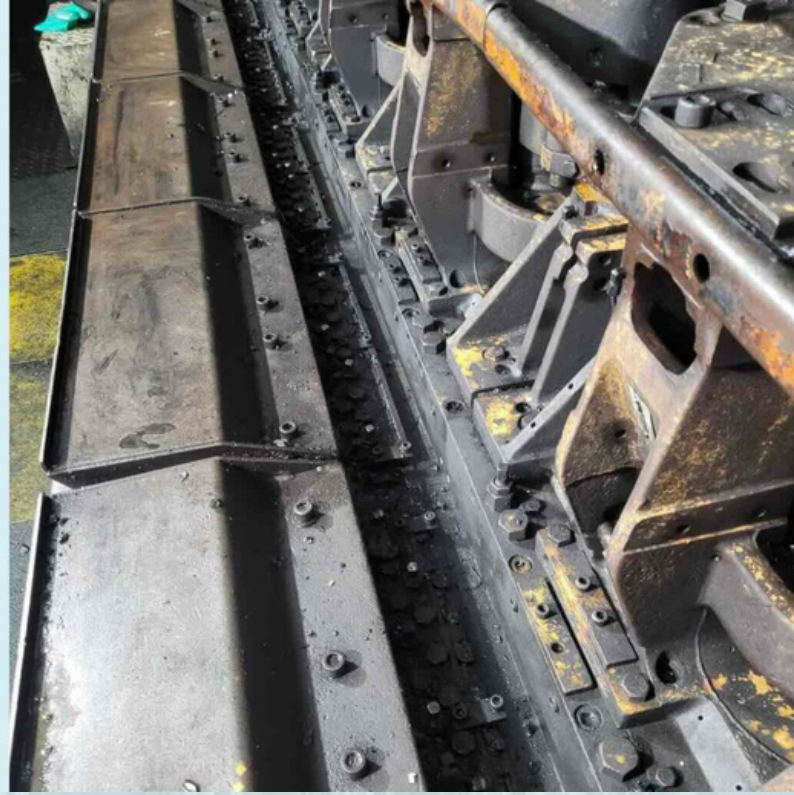

## Clean down and project completion

All floor areas are cleaned of waste materials generated by the cleaning process. We ensure that the machine and immediate area is cleared away so that production can restart.

The client will receive a comprehensive report, detailing all works completed.
