Lehr Cleaning Services

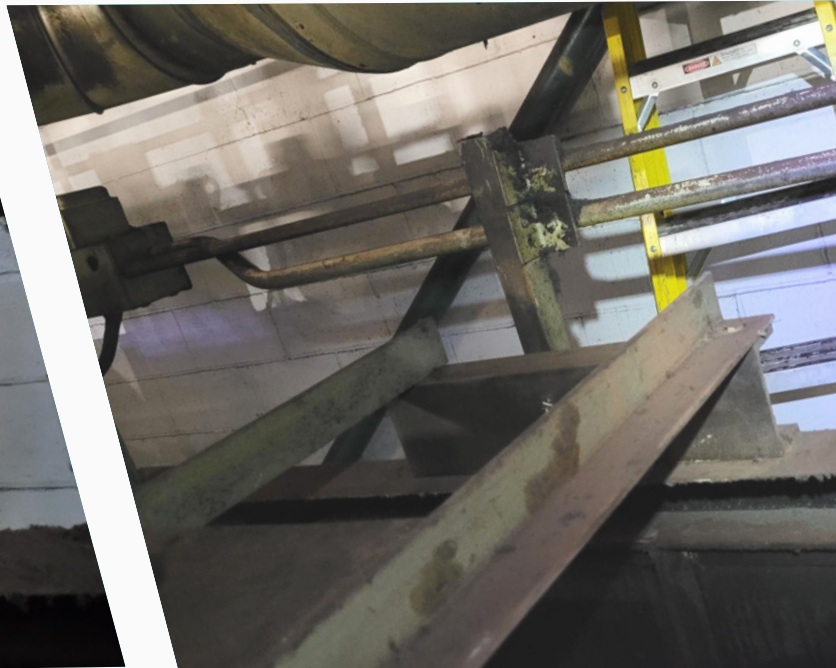

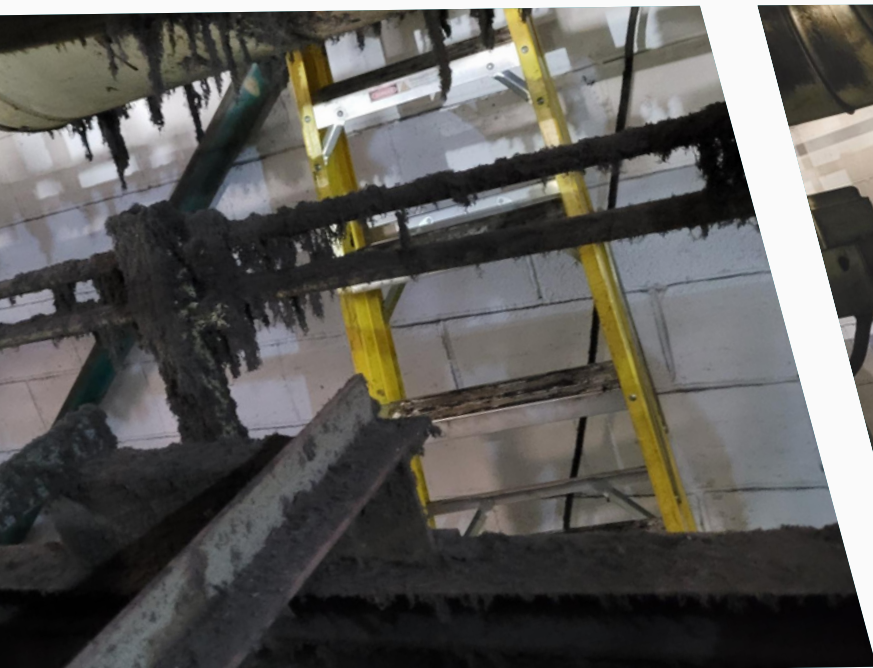

Overview

Kingfisher Industrial Services have over 15 years of experience in **specialised cleaning for the glass manufacturing industry**. Over the years, we have developed bespoke and specialised cleaning solutions that very few companies can deliver. **Lehr cleaning is one of them.**

We understand the importance of maintaining continuous production and not allowing any contaminants to tarnish your products.

However, as you can see from the photos below, over time the internal structures of Lehrs can **accumulate substantial build-ups of dust, grime and debris**. It is not something that you'd wish to see contaminating your glass containers!

Through our Lehr cleaning services, our clients have been able to **take advantage of scheduled maintenance periods** to deep clean their Lehrs while experiencing **no delays in restarting production**.

Lehr Cleaning Services

The Process

Kingfisher have developed a **specialised working method** for cleaning the internal structure of lehrs. This cleaning work takes place while the Lehrs are out of commission, meaning the internal temperatures are cool enough for our **operatives to safely enter and clean the Lehrs.**

Our experienced team **clean all internal walls and surfaces in each zone of the Lehr.** The belt guides are then cleared of dust and debris with a **high-powered industrial strength vacuum**, to reduce the risk of contamination to the product.

A Health and Safety Manager conducts gas safety readings periodically throughout the project in line with confined space training and regulations.

**FULLY CONFINED
SPACE TRAINED**

**BOOK DURING PLANNED
DE-COMMISSIONING**

**BESPOKE WORKING
METHOD**

FIRE PREVENTION AND RESPONSE CLEANS

Kingfisher also offer Lehr cleaning services in cases **where there has been a fire at your industrial facility**. This gives you peace of mind that your essential machinery is **de-contaminated and clean ready for re-commissioning**.

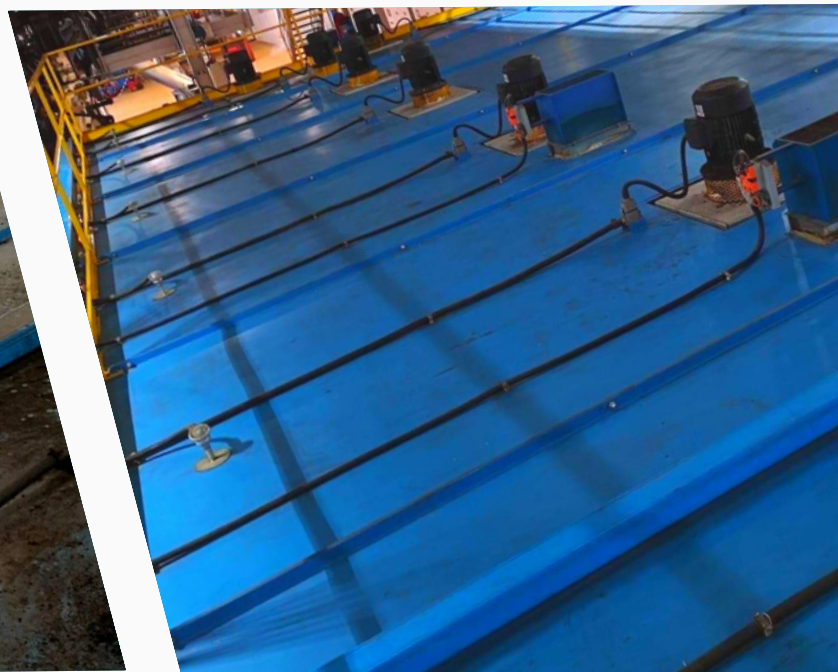

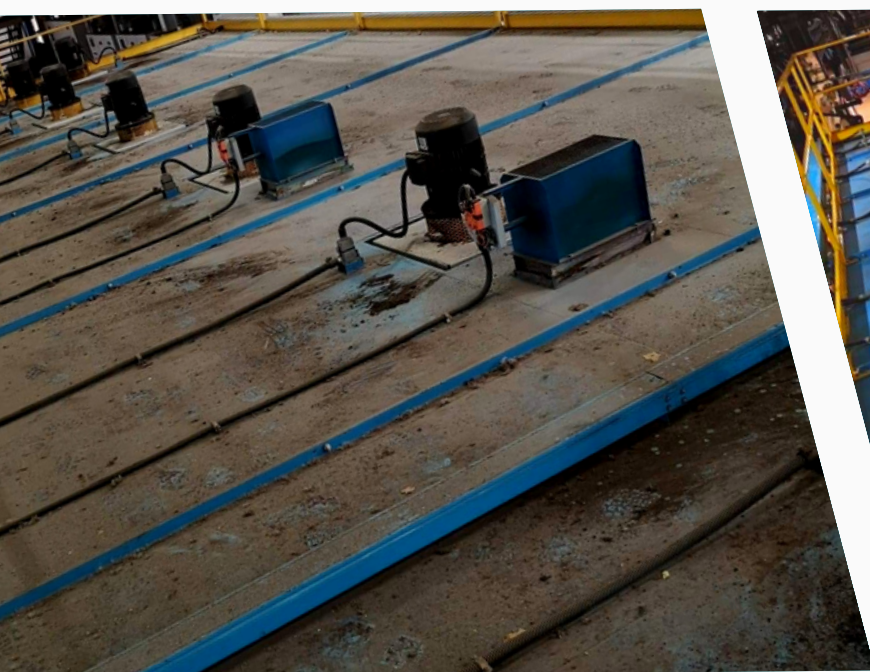

Lehr cleaning can also help **prevent fires by removing dust, grime and contaminants within the machinery**. This is particularly important if the Lehrs do not receive periodic cleaning and have accumulated a substantial amount of dirt and grime.

LEHR ROOF CLEANS

It is an excellent idea to take advantage of shut-down maintenance periods to clean all Lehr roofs, when the structure is **cool enough for operatives to work safely**.

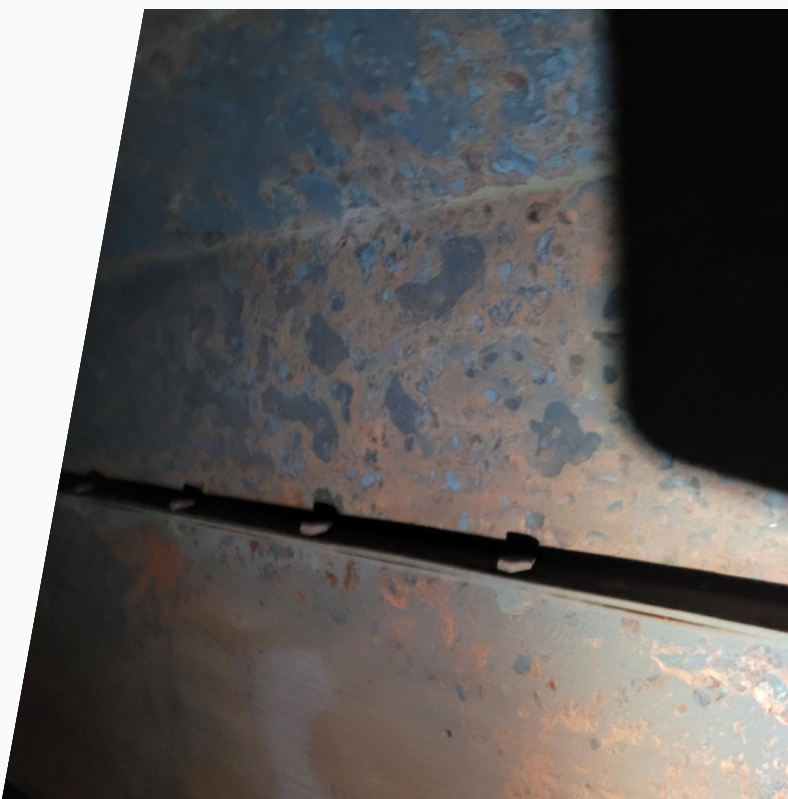

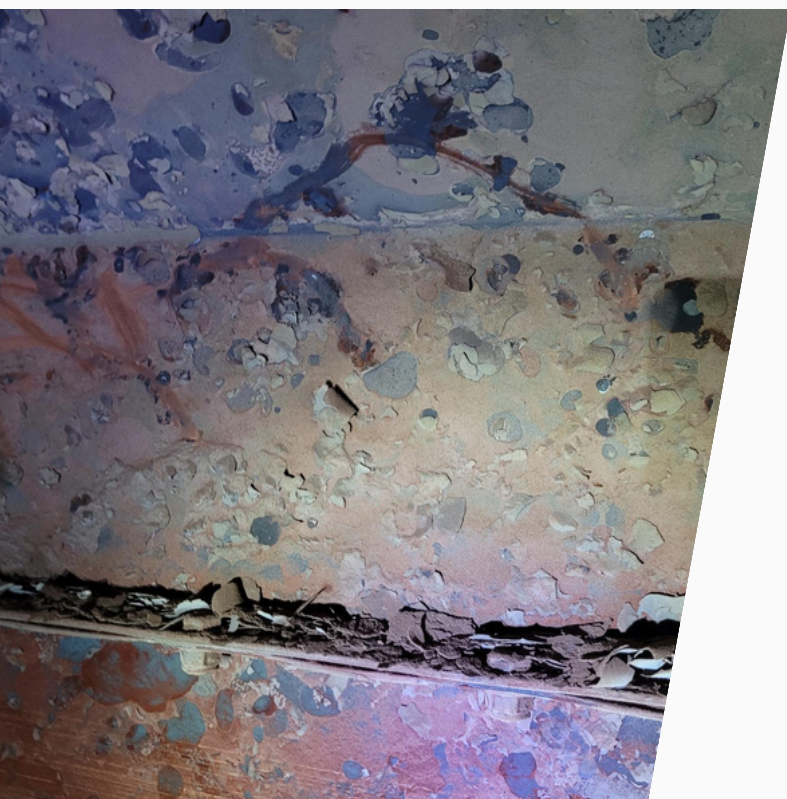

The removal of dust, oil and grime is another **fire prevention strategy**, and can reduce the risk of agitated material contaminating products on the production line.

Not to mention, a clean and respectable Lehr is much more **impressive to visitors and customers** than one coated in dust and oil.
